# pyrolite: A Quick Tour

- What is pyrolite? Why does it exist?
- Handling geochemical data
- Visualisation
- Putting geochem data to work
- **Demonstration**
- Get Involved

# What is pyrolite?

- A set of tools for working with geochemical data
- An open source Python package (a bundle of reusable code)
- A project under active development, aiming to eventually be community-driven
- Part of a broader ecosystem of interoperable tools within the scientific Python ecosystem

## pyrolite: Python for geochemistry

### Software

- [Review](#) ↗
- [Repository](#) ↗
- [Archive](#) ↗

`pyrolite` is a Python package for working with multivariate geochemical data, with a particular focus on rock and mineral chemistry. The project aims to contribute to more robust, efficient and reproducible data-driven geochemical research.

# What's the bigger idea?

Encouraging a programmatic approach to geochemical data analysis:

- Defining explicit workflows
- Reproducibility and reuse of research code
- Interoperability and automation
- Scalability and flexibility

To support this:

- Accessibility
- Community
- Education

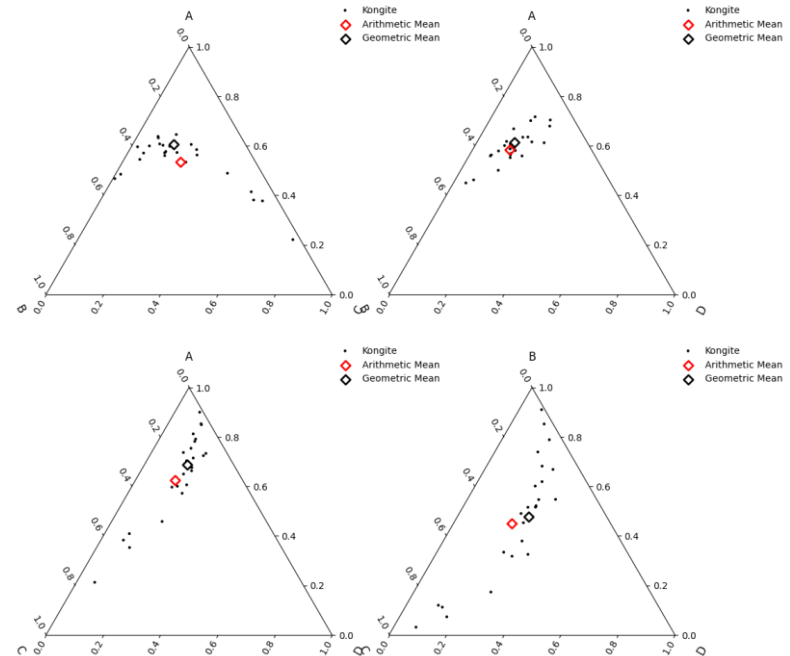

# Handling Geochemical Data

- Transformation (elements, oxides, minerals, normalization)
- Reference compositions and mineral composition databases

# Handling Geochemical Data

- Transformation (elements, oxides, minerals, normalization)
- Reference compositions and mineral composition databases
- Compositional data – logratio transforms!
- Provide some specialized functionality to complement general tools
- Linking all of this directly to your dataset (data-centric, via Pandas)

# Visualisation

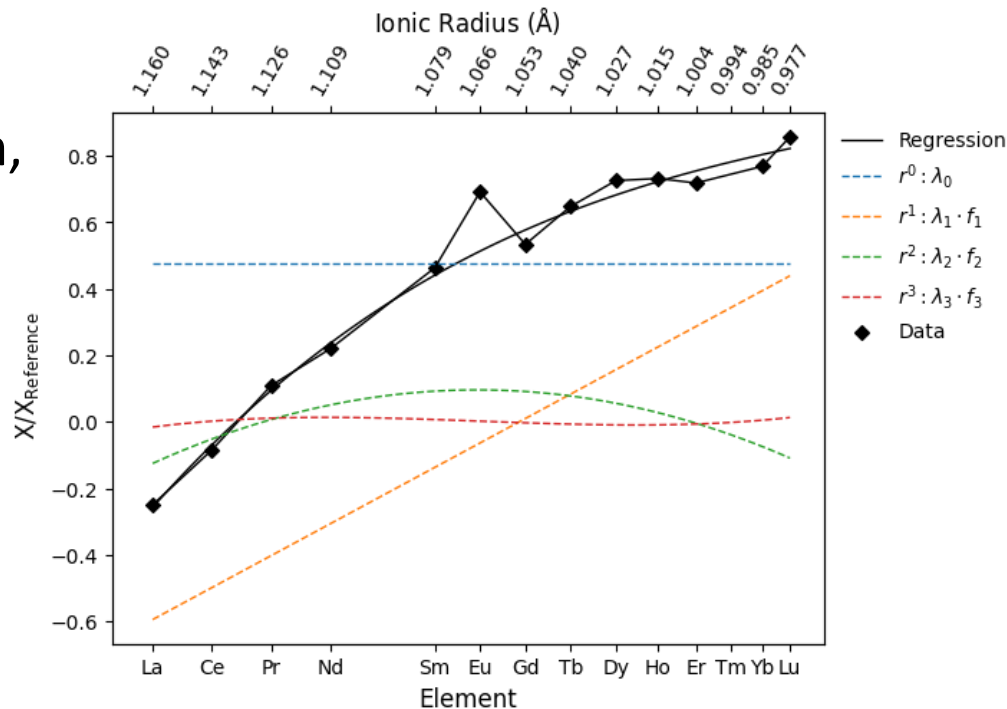

- Ternary diagrams
- Spider diagrams
- Addressing overplotting with data density-based visualisation methods
- Interface reflects the tools it's built on top of (e.g. matplotlib) in order to be interoperable
- Highly customisable

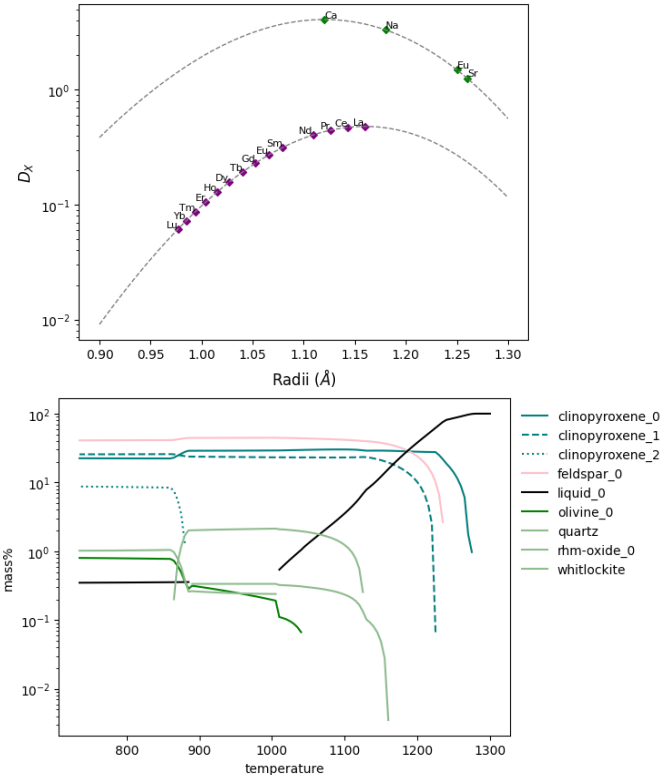

# lambdas

- Customisable implementation of orthogonal polynomial regression, after O'Neill (2016)
  - Consistent with O'Neill (2016) using the same parameterisation
  - Updated to default to be consistent with AlambdaR/BlambdaR
- Tetrads, anomalies, fit measures and parameter uncertainties added in development version (will be released in v0.3.0)

# Linking Geochem Data to Modelling and ML

- To get the most out of our geochemical data, we'll need to be able to link it to a variety of different tools
  - Modelling (e.g. lattice strain, alphaMELTS)
  - Machine learning
- The scientific Python ecosystem comes with 'batteries included'

# pyrolite.rtfd.io

## Plotting Examples

pyrolite provides some functionality for basic plotting of geochemical data in the form of spidergrams (`pyrolite.plot.spider`), ternary diagrams (`pyrolite.plot.tern`) and density diagrams (i.e. 2D histograms, `pyrolite.plot.density`).

Plot Templates

Stem Plots

Ternary Plots

REE Radii Plots

Using Manifolds for Visualisation

Parallel Coordinate Plots

Heatscatter Plots

Density and Contour Plots

Spiderplots & Density Spiderplots

# Quick Demo

- Pulling in some data
- Simple visualisation
- Getting started with lambdas and tetrads

## REE & Software Workshop - pyrolite

docs failing License MIT chat on gitter @metasomite

This repository contains the pyrolite component for the 2021-02-22 Mineralogical Society Applied Mineralogy Group [workshop on REE and related software](#).

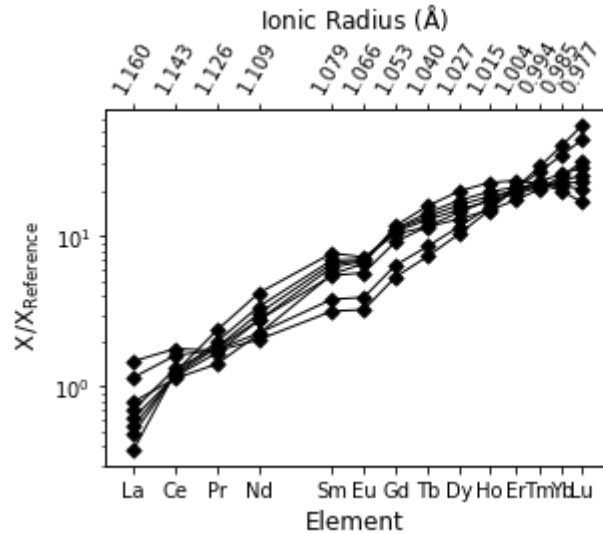

pyrolite is a set of tools for working with geochemical data written in Python. It aims to help geoscientists quickly get of the ground and make use of their data. It contains a variety of functionality for the processing, transformation and visualisation of geochemical data. To view the notebooks for this workshop, follow the link below:

# Anomalous Anomalies?

# Get Involved

- Want help getting started?
- Find something which looks like a bug?
- Want to be able to do something, but not sure how/if its possible?
- Want to get involved with the project, or have ideas where it should go?
- Keen to make the project more sustainable?

```

# Some Perspectives on Getting Started

- Start where you are. For new coders, it'll take a while to get used to. Don't expect to learn everything overnight.
- Play around with the examples, then try working with your own data. Having a project or objective in mind helps with the learning process!
- I still have to look up lots of things, even for my own code. This probably won't change!

# And a range of other utilities...
